Dear Body Repair Workshop Owner,

The **ISAM** bumper you purchased was primed in our latest cutting-edge painting plant making use of top quality bi-component paints.

All items are flame-hardened before priming to grant a perfect adhesion of the product to the bumper surface, and dried for about 40 minutes in the oven. All bumpers marked with the adhesive “**QUALITY PRIMER**” sticker on the packaging have been painted in this new plant.

TRUST our primer and do not repeat the priming process.

To paint **ISAM QUALITY PRIMER** bumpers in the shade of the body work, simply sandpaper with fine p600-p800 paper and clean with anti-silicone solvent. An important notice for all bumpers scheduled for painting, both OE and those that are equivalent to the original: after applying paint in the shade of the body work, wait at least 6 weeks (total stabilisation time of the paint) before washing the car with a pressure wash or taking it to the car wash.
